- Nutritional deterioration: due to oxidation or moisture loss.
- Pest infestation: leading to physical damage and contamination.
- Shelf life limitations: restricting distribution and market reach.

By integrating nanotechnology, researchers can design targeted and efficient systems that mitigate these challenges more effectively than conventional techniques.

Principles and Techniques Underpinning Nano Post Harvest

Nanomaterials in Food Preservation

At the core of nano post harvest are various nanomaterials, including nanoparticles, nanocomposites, nanoemulsions, and nanostructured coatings. These materials exhibit properties such as:

- Enhanced antimicrobial activity
- Improved barrier functions
- Controlled release of preservatives or nutrients
- Increased surface area for interactions

Commonly used nanomaterials include silver, zinc oxide, titanium dioxide, and chitosan nanoparticles, each chosen for their specific functionalities.

Nano-Enabled Packaging

Nano-enabled packaging forms a significant part of nano post harvest strategies. These packaging materials incorporate nanomaterials to improve:

- Barrier properties: reducing oxygen and moisture transmission.
- Antimicrobial effects: preventing microbial growth on the produce surface.
- Sensor capabilities: indicating spoilage or microbial contamination.

For example, incorporating silver nanoparticles into packaging films can inhibit bacterial proliferation, thereby extending freshness.

Nano-Coatings and Films

Nano-coatings are thin layers applied directly onto produce surfaces or packaging substrates. They serve to:

- Create a protective barrier against moisture, oxygen, and contaminants.
- Modulate gas exchange to slow respiration rates.
- Deliver antimicrobial agents in a controlled manner.

These coatings are often transparent, biodegradable, and can be tailored to specific produce types.

Nano-Sensors for Monitoring

Nano-sensors integrated into packaging or storage environments enable real-time monitoring of parameters such as temperature, humidity, ethylene release, or microbial activity. This data-driven approach helps optimize storage conditions and predict spoilage timelines.

Applications of Nano Post Harvest in Food Preservation

Extending Shelf Life

Nanotechnology offers promising solutions for prolonging the freshness of perishable foods. For example:

- Nano-coatings on fruits can reduce moisture loss and respiration rates.
- Antimicrobial nanomaterials embedded in packaging inhibit bacteria, fungi, and yeasts that cause spoilage.
