Initial Consultation and Case Design

Understanding Patient Needs

The process begins with collaboration between the dentist and the lab technician. The dentist provides detailed case information, including patient's dental history, clinical photographs, intraoral scans, and diagnostic wax-ups if available. This information guides the lab in designing restorations that match the patient's anatomy, occlusion, and aesthetic desires.

Case Planning and Design

The lab technician reviews all provided data to develop a treatment plan. This stage involves:

- Assessing the type of restoration needed
- Choosing appropriate materials
- Creating digital or physical mock-ups
- Communicating with the dentist to finalize specifications

Advanced digital design software may be employed to simulate the final outcome, allowing for adjustments before fabrication.

Impression and Model Fabrication

Taking Accurate Impressions

Accurate impressions are critical for a successful restoration. The dentist captures the patient's dental arches using materials like silicone or polyether. These impressions are then sent to the lab.

Model Creation

The impressions are poured with dental stone to produce precise physical models, which serve as the foundation for further procedures. Alternatively, digital impressions obtained via intraoral scanners can be directly imported into CAD/CAM software, streamlining the process.

Digital Workflow and CAD/CAM Integration

Designing with Digital Tools

Many modern dental labs, including Rudd Morrow, utilize computer-aided design and manufacturing (CAD/CAM) technology. The steps include:

- Importing digital impressions or scans into CAD software
- Designing restorations with precise control over anatomy, contacts, and occlusion
- Simulating the final appearance and fit of the prosthetic

Fabrication via CAM Technology

Once the design is finalized, the file is sent to CNC milling machines or 3D printers:

- Choosing the appropriate material (ceramics, resins, metals)
- Carving or printing the restoration with high precision
- Performing post-processing steps like sintering or glazing

Material Selection and Processing

Types of Materials Used

The choice of material depends on the type of restoration, aesthetic requirements, and functional demands. Common materials include:

- Porcelain and ceramic composites for crowns and veneers
- Metal alloys such as gold, palladium, or nickel-chromium for frameworks
- Resin-based materials for provisional restorations
- High-strength zirconia for durable crowns and bridges

Processing Techniques

After fabrication, restorations undergo several processing steps:

Firing and Sintering Ceramic restorations are fired in kilns to achieve optimal strength and aesthetic properties.
Glazing and Polishing Applying glaze enhances esthetics and smoothness, improving both appearance and longevity.
Try-in and Adjustments The dentist evaluates the restoration in the patient's mouth, making necessary adjustments for fit and occlusion.

Final Fitting and Delivery

Seating the Restoration

The dentist seats the restoration, ensuring proper fit, contact points, and aesthetics. The lab provides guidance on any modifications needed.

Bonding and Cementation

Using appropriate dental cements or adhesives, the dentist permanently affixes the restoration. Proper curing and finishing ensure durability.

Post-Placement Care

Patients are advised on maintenance routines to preserve their restorations, including oral hygiene practices and regular check-ups.
