A loop-erased random walk is a process where loops formed during a random walk are systematically removed to produce a simple path, which is a key step in Wilson's algorithm for generating spanning trees. Can Wilson's algorithm be applied to weighted graphs? Wilson's algorithm is primarily designed for unweighted graphs, but with modifications, it can be adapted for weighted graphs by biasing the random walks according to edge weights. What are the computational advantages of using Wilson's algorithm? Wilson's algorithm is efficient and easy to implement, especially for large graphs, as it relies on simple random walk procedures and guarantees uniform sampling of spanning trees. Is Wilson's algorithm suitable for directed graphs? Wilson's algorithm is mainly designed for undirected graphs. Example Problems and Solutions

Example 1: Two-Variable Word Problem

Problem:

Gina Wilson 2012 algebra problem: A store sells pencils and erasers. The total cost for 3 pencils and 2 erasers is \$5.50. If each pencil costs \$0.50, what is the cost of each eraser?

Solution:

Step 1: Define variables:

Let x = cost of one eraser.

Step 2: Write the equation based on the problem:

Cost for 3 pencils = $3 \times \$0.50 = \1.50

Total cost: $1.50 + 2x = 5.50$

Step 3: Set up the equation:

$$3(0.50) + 2x = 5.50$$

$$0.50(3) + 2x = 5.50$$

Step 4: Simplify and solve for x:

$$1.50 + 2x = 5.50$$

$$2x = 5.50 - 1.50$$

$$2x = 4.00$$

$$x = 4.00 / 2$$

$$x = 2.00$$

Answer: Each eraser costs \$2.00.

Example 2: System of Equations Word Problem

Problem:

Gina Wilson 2012 algebra problem: A train travels from city A to city B at 60 mph. The same train travels from city B to city A at 40 mph. If the distance between the two cities is 180 miles, how long does each trip take?

Solution:

Step 1: Define variables:

Let t = time (in hours) for the trip from city A to B.

Step 2: Set up equations:

Time from A to B: t

$$\text{Distance} = \text{speed} \times \text{time} = 60 \times t$$

Similarly, for B to A, the time is $(180 / 40) = 4.5$ hours, but since the problem asks for the time based on the variable, we can verify the total distance:

$$\text{Total distance: } 60t + 40t = 180$$

Step 3: Write the equation:

$$60t + 40t = 180$$

Step 4: Simplify and solve:

$$100t = 180$$

$$t = 180 / 100$$

$$t = 1.8 \text{ hours}$$

Step 5: Find time in hours for each trip:

- From city A to B: 1.8 hours
- From city B to A: $180 / 40 = 4.5$ hours

Answer: The trip from city A to B takes approximately 1.8 hours, and the return trip takes 4.5 hours.

Gina Wilson is an influential educator and curriculum developer known for her innovative approaches to teaching mathematics. Her 2012 Algebra System Word Problems are part of a broader effort to make algebra accessible and engaging, especially for high school students preparing for standardized assessments.

The Purpose of the Word Problems

These word problems are crafted to:

- Reinforce algebraic concepts such as linear equations, inequalities, systems of equations, and quadratic functions.
- Bridge the gap between abstract algebraic methods and real-life applications.
- Develop critical thinking and analytical skills through contextualized scenarios.

Structure and Content of the Word Problems

The Design Philosophy

Gina Wilson's word problems are characterized by their:

- Real-world relevance: Problems are designed around everyday scenarios like shopping, travel, sports, and household tasks.
- Progressive difficulty: They start with straightforward problems and gradually increase in complexity.
- Clear language: Concise wording to avoid confusion and focus on algebraic reasoning.

Types of Problems Included

The 2012 system encompasses various categories:

- Linear Equations and Inequalities

Problems involving determining the value of variables within linear constraints.

- Systems of Equations

Scenarios requiring simultaneous equations solutions, such as mixture problems or motion.

- Quadratic Word Problems

Situations involving parabolic relationships like projectile motion or area optimization.

- Application and Word Problem Mix

Problems integrating multiple algebraic concepts to simulate real-world decision-making.

Deep Dive into Typical Word Problem Examples

Linear Equations and Inequalities

Example:

A family is planning a road trip. They have a budget of \$500 for gas and lodging. If the cost of gas is \$3 per gallon and lodging costs \$100 per night, how many nights can they stay if they plan to spend exactly \$500?

Analysis:

- Let g be gallons of gas, and n be the number of nights.
- The total cost: $(3g + 100n = 500)$.
- Additional constraints or inequalities might be added to reflect realistic limits.

Educational Value:

These problems promote understanding of linear relationships, substitution, and equality solving, while grounding algebra in relatable contexts.

Systems of Equations

Example:

A local gym offers two membership plans: a monthly plan costing \$30 per month, and a yearly plan costing \$300 upfront. If a customer chooses to pay for 6 months and spends the same amount as the monthly plan, what is the number of months needed to break even with the yearly plan?

Analysis:

- Set up equations: $(30 \times 6 = 300)$ (monthly plan total cost).
- Students analyze when paying monthly becomes cost-effective compared to a lump-sum annual payment.

Educational Value:

These problems develop skills in solving systems of equations, comparing options, and understanding cost-benefit scenarios.

Quadratic Word Problems

Example:

A ball is thrown upward with an initial velocity of 20 meters per second. Its height $h(t)$ in meters after t seconds is modeled by $h(t) = -4.9t^2 + 20t$. When will the ball reach a height of 15 meters?

Analysis:

- Set $h(t) = 15$: $-4.9t^2 + 20t = 15$.
- Rearranged as a quadratic: $-4.9t^2 + 20t - 15 = 0$.
- Students solve using quadratic formula, factoring, or completing the square.

Educational Value:

These problems foster understanding of quadratic functions, vertex form, and real-world physics applications.

Pedagogical Strengths and Benefits

Enhancing Conceptual Understanding

Gina Wilson's word problems are carefully designed to promote a deep understanding of algebraic principles. Instead of rote procedures, students are encouraged to interpret scenarios, formulate equations, and analyze solutions critically.

Promoting Critical Thinking

By embedding algebra within real-life contexts, these problems challenge students to think beyond mechanical calculations. They must decide which variables to define, select appropriate methods, and interpret their results meaningfully.

Building Problem-Solving Skills

The incremental difficulty and variety of problems develop resilience and adaptability. Students learn to approach unfamiliar problems systematically, a vital skill for standardized tests and beyond.

Solution Approach:

- Identify Known Values:
 - Mass (m) = 5 kg
 - Angle (?) = 30°
 - Distance (d) = 10 m
- Apply Energy Conservation:
 - Potential energy at the top converts to kinetic energy at the bottom.
 - $PE = m g h$
 - $h = d \sin(?) = 10 \sin(30^\circ) = 10 \cdot 0.5 = 5 \text{ m}$
- Calculate Initial Potential Energy:
 - $PE = 5 \cdot 9.8 \cdot 5 = 245 \text{ Joules}$
- Calculate Velocity at Bottom:
 - $KE = 0.5 m v^2$
 - Set $PE = KE$:

- $245 = 0.5 \cdot 5 \cdot v^2$
- $v^2 = 245 / 2.5 = 98$
- $v = \sqrt{98} \approx 9.9 \text{ m/s}$
