Theoretical Foundations of Mills' Solutions

Understanding Mills' solutions requires familiarity with fundamental equations governing heat and mass transfer:

- Governing Equations

- Heat conduction is described by Fourier's law and the heat equation:

$\nabla^2 T = \frac{1}{\alpha} \frac{\partial T}{\partial t}$

$$\frac{\partial T}{\partial t} = \alpha \nabla^2 T$$

where T is temperature, t is time, and α is thermal diffusivity.

- Mass diffusion follows Fick's second law:

$\nabla^2 C = \frac{1}{D} \frac{\partial C}{\partial t}$

$$\frac{\partial C}{\partial t} = D \nabla^2 C$$

where C is concentration and D is diffusivity.

- Boundary and Initial Conditions

Mills often employs specific boundary conditions such as constant surface temperature/concentration, convective boundary conditions, or phase change interfaces to model realistic scenarios.

- Dimensionless Parameters

By nondimensionalizing equations, solutions become more generalizable:

- Nusselt number (Nu): ratio of convective to conductive heat transfer.
- Sherwood number (Sh): ratio of convective to diffusive mass transfer.
- Biot number (Bi): ratio of internal conduction resistance to external convection resistance.
